

“Understanding the human cutaneous nerve supply is important in the assessment of a wide range of clinical scenarios. In case of neuronal lesions, these extend well beyond the territory of the Neurologist into, for example, the fields of trauma, orthopaedics and infections.” (3rd edition) – Foreword: Prof J. Fraher. Montpellier, Paris: Sauramps Médical.

I.S.B.N. (Hardbook) : 978-3-030-45963-5.

I.S.B.N. (ebook) : 978-3-030-45964-2.

This atlas is the result of **research** involving **over 3,000 patients** consecutively recruited since 2004. Clinical practice gives the opportunity to observe many more A β axonal lesions (axonotmesis) than transections (neurotmesis), consequently the mapped hypoaesthetic territories are partial. Therefore, the authors define for each cutaneous nerve branch, the autonomous territory and the **boundary markers** of the largest territory of cutaneous origin. Each anatomical chart of a cutaneous branch is the superposition of tens, even hundreds of observations seen in clinical practice – based on 3,133 maps of observed cutaneous hypoaesthetic territories. The data collected has also been cross-referenced with that published in nearly 100 other anatomy books.

This **1st English edition¹** – based on the 3rd French edition published by Sauramps Medical – illustrates the usefulness of anatomical knowledge for clinical practice. More precisely, it seeks to demonstrate how these topographic elements can offer valuable support, both for the clinical anamnesis, and for the clinical examination of neuropathic pain patients.

This atlas is at the crossroads between the medical and rehabilitation disciplines. Accordingly, it addresses the needs of medical doctors, from GPs to specialists, and of pain therapists, and offers a valuable asset for all health professionals who are dedicated to the management of pain and associated problems.
