

Fig. 7: Time course of disappearance for 270 SMA as a function of hypersensibility severity (rainbow pain scale in grams), given by a distribution in the form of a box and whiskers plot. Going from left to right, time values given by the horizontal thick black lines are median in days to switch from SMA to underlying hypoaesthesia.

In particular, the mean of disappearance is as follow (Table VII):

Table VII: $o \equiv mean time of SMA disappearance in the present study (n = 270 SMA)$ $<math>\mathbf{x} \equiv mean time of SMA disappearance in Spicher et al., 2008 (n = 63 SMA).$
